8. Acceptance Criteria	36–37
9. Validation Questions	38
10. Conclusion	38

Food Delivery

INTRODUCTION

This Software Requirements Specification (SRS) document provides a comprehensive description of the functional and non-functional requirements of the Food Delivery Application. It defines the system's functionalities, features, constraints, and specifications required for its development and implementation. This document serves as a reference for developers, testers, and other stakeholders throughout the software development process. It also provides a foundation for preparing the system design, implementation, and test plans.

1. Purpose

The Software Requirements Specification (SRS) provides a detailed description of the requirements for the Food Delivery Application (FD). It clearly defines the functional and non-functional requirements, major features, and expected behaviour of the system. This document provides a clear understanding of what the application should accomplish and serves as a foundation for the design, development, and testing phases of the project.

The SRS will be used by software developers, designers, testers, project managers, and end users. Developers will use it to understand and implement the required functionalities, while testers will use it to prepare test cases and verify that the application meets the specified requirements. End users and stakeholders can use this document to review the system requirements and ensure that the final application meets their expectations.

1.1 Scope

The software product to be developed is a Food Delivery System (FD) designed to automate and simplify the major operations involved in online food ordering and delivery. The system will allow customers to browse available food items, place orders,

make payments, and track their deliveries. It will also help restaurant staff manage food items, customer orders, payments, and delivery status.

There are two primary end users of the Food Delivery System: customers and restaurant staff. Customers can use the system to view menus, place and track orders, and manage their accounts. Restaurant staff can manage menus, receive and process orders, update order status, and monitor deliveries. The system will provide appropriate access and functionalities based on the user's role.

1.2 Definitions, Acronyms, and Abbreviations SRS –

- **Customer:** User who orders food
- **Restaurant:** Food provider
- **Delivery Partner:** Person who delivers food
- **Admin:** System administrator
- **OTP:** One-time password
- **API:** Application Programming Interface
- **FD:** Food delivery

1.3 Intended users

- Customer
- Restaurant owner
- Delivery Partners
- System Administrators

1.4 References

- IEEE 830 software requirement specification standard.
- UML 2.x Specification.
- Software engineering course material.

2. The Overall Description

This section provides an overview of the factors that influence the Food Delivery Application and its requirements. It describes the general characteristics, users, operating environment, constraints, and assumptions of the system. This section does not define specific requirements; instead, it provides the necessary background and context to help understand the detailed requirements of the application.

2.1. Product perspective

The application is a web and mobile-based system that connects customers, restaurants, and delivery partners. The system interacts with external partners such as payment gateways for online payments, GPS/Maps, APIs for location tracking, and notification services for SMS and email alerts. It uses a central database to store user, restaurants, menu and order information. The application is intended to replace the traditional phone-based food ordering process with a faster and more efficient digital platform.

2.1. 1. System Interface

The Food Delivery Application will be accessible through modern web browsers and mobile devices. The web application will support the latest versions of popular browsers such as Google Chrome and Mozilla Firefox on Windows, Linux, and macOS operating systems. The mobile application will support smartphones running Android 8.0 or later.

2.1. 2. User Interface

The user interface screens of the Food Delivery Application are described below:

Login / Registration: Allows customers, restaurant staff, and administrators to log in or create an account.

Home / Menu: Displays available restaurants, food items, prices, and other relevant details.

Food Ordering: Allows customers to select food items, add them to the cart, and place orders.

Cart: Displays the selected food items and allows customers to update quantities or remove items before placing the order.

Payment: Allows customers to make secure payments for their food orders using available payment methods.

Order Tracking: Allows customers to view the current status and delivery progress of their orders.

Customer Profile: Allows customers to view and update their personal information and delivery address.

Admin / Restaurant Dashboard: Allows authorized users to manage food items, customer orders, payments, and delivery status.

2.1.3. Software Interface

The Food Delivery Application will store and manage data related to users, food orders, customers, and payments. The system will maintain separate databases or modules for Login and User Management, Food Ordering, Customer Records, and Payment Information.

Only authorized users, such as administrators and restaurant management staff, will be permitted to modify important system data. Customers will be able to view their information, place orders, make payments, and cancel orders according to the system's cancellation policy.

The Order Database will store details of all orders, including ordered food items, quantities, order status, and delivery information. The Payment Database will maintain payment details and transaction status, while the Customer Database will store customer information and delivery details.

The system will interface with a suitable relational database management system (RDBMS) such as MySQL, Oracle, or Microsoft Access.

2.1. 4. Hardware Interface

The Food Delivery Application will be accessible through devices running Microsoft Windows, Apple iOS, and Android operating systems. Users will be able to access the system using desktop computers, laptops, tablets, and smartphones with a compatible internet connection.

The system will utilize the device's basic hardware components, such as the display, keyboard, mouse, touchscreen, and network interface, to provide a smooth and user-friendly experience.

2.1. 5. Communication Interface

The Food Delivery Application will require communication interfaces to connect users, restaurants, payment services, and delivery services. The system will use an internet connection to exchange data between the application and its server.

Communication will primarily take place through HTTP/HTTPS protocols. The system will also support communication with external payment gateways and notification services where required.

2.2. Product features

The Food Delivery Application will provide the following major functions:

Ordering and Delivery System

- Allows customers to enter and manage their personal and delivery information.
- Displays food items with their default prices, which can be updated by authorized restaurant staff.
- Provides a description field for food items, price changes, and special offers.
- Generates a unique order number for each customer order and records it in the database.

- Allows customers and authorized staff to modify or update orders before confirmation.
- Maintains a waiting list when a requested food item or delivery service is temporarily unavailable and processes requests when it becomes available.
- Displays the total amount payable when an order is confirmed or completed.
- Records and maintains payment information for each order.
- Allows customers to cancel orders according to the cancellation policy.
- Allows customers to track the status of their orders from confirmation to delivery.
- Updates the order status as it progresses through preparation, dispatch, and delivery.
- Maintains order history for customers and restaurant staff.

2.3. User Characteristics

There are two main types of users of the Food Delivery Application:

- **Admin**
- **Customer**

Admin

The Admin has the highest level of access and is responsible for managing the overall application. The Admin can:

- Manage the overall application and its users.
- Manage and maintain the system database.
- Add, update, and remove food items and their details.
- Manage restaurant menus, prices, and availability.
- Manage and monitor customer orders.
- Manage payments and delivery information.

- Handle customer complaints and queries.
- Monitor the overall performance and operation of the system.

Customer

The Customer uses the application to order food and manage their orders. The Customer can:

- Register and log in to the application.
- Browse restaurants and available food items.
- View food details, prices, and availability.
- Add items to the cart and place orders.
- Make payments for orders.
- Modify or cancel orders according to the applicable policy.
- Track the status of their orders.
- View their order history and manage their profile.

2.4. User classes

- **Customer**
 1. Register/login
 2. Browse restaurants
 3. Search food
 4. Place orders
 5. Track orders
 6. View order history
 7. Rate restaurants
- **Restaurant Owner**
 1. Manage menu
 2. Accept/reject orders
 3. Update order status

4. View sales report

- **Delivery partner**

1. Accept delivery requests
2. Navigate to customer location
3. Update delivery status
4. Validate customer

- **Administrator**

1. Manage users
2. Manage restaurants
3. Generate reports
4. Monitor orders

2.5. Assumptions and Dependencies

It is assumed that the Food Delivery Application will operate effectively on supported operating systems and will be developed using a suitable server environment and MySQL database.

The system is dependent on a stable internet connection, server availability, and the proper functioning of the database and other required software components.

The SRS should remain flexible enough to accommodate necessary changes or modifications if any technical difficulties, new requirements, or system constraints arise during development.

2.6. Operating environment

- Android application
- Ios application
- Web browser
- Internet connection
- MySQL data base server

2.7. User documentation

The food delivery app will include comprehensive user documentation to help different types of users operate the system effectively. Customers will have access to a user guide explaining account registration, login, food ordering, and payment, methods, order tracking, and profile management. Restaurant will receive documentation on menu management, order processing, and sales reporting. Delivery partners will be provided with instructions for accepting deliveries, navigating routes, and updating delivery status. An in-app help section, FAQs, and troubleshooting guide will also be available to assist users with common issues.

2.8. Constraints

The following constraints apply to the development of the Food Delivery Application:

- The project must be completed within the specified time period, covering planning, designing, development, testing, and deployment.
- The project must be completed within the allocated budget.
- All defined entry and exit criteria for each development stage must be satisfied.
- The application should be user friendly, reliable, secure, and maintainable while following appropriate industry standards.
- The system architecture and design should be flexible and scalable, allowing additional features to be added in the future with minimal effort.
- The development team will provide the software application, while the client will be responsible for providing the required hardware and infrastructure.
- The system should regularly synchronize and back up data to a backup server to prevent data loss in case of system failure or other technical problems.

3. Specific requirements

This section contains all the software requirements at a level of detail, that when combined with the system context diagram, use cases, and use case descriptions, is sufficient to enable designers to design a system to satisfy those requirements, and testers to test that the system satisfies those requirements.

3.1. External interface requirements

The Food Delivery Application will interact with standard input and output devices available on computers and mobile devices. These interfaces will allow users and administrators to interact with the system efficiently.

The system will support the following devices:

- **Keyboard:** Used for entering login details, customer information, search queries, and other data.
- **Mouse:** Used for navigating menus, selecting options, and interacting with the application on computers.
- **Monitor/Display:** Used to display the application interface, food items, order details, payment information, and notifications.
- **Printer:** May be used by restaurant staff to print order details, invoices, or receipts.
- **Touchscreen:** Supported on smartphones and tablets for convenient interaction with the application.

3.2. Functional requirements

Functional requirements define the fundamental actions that system must perform. The functional requirements for the system are divided into various main categories, Registration, Logging in, payment, ordering, etc.

3.2.1. User Registration

The Food Delivery Application shall provide a registration facility for new customers. Customers will be required to provide the necessary details to create an account.

The system shall:

- Allow customers to register using their name, email address, password, and delivery address.
- Store customer registration details securely in the Customer Database.
- Send a verification email to the registered email address to confirm the customer's account.

3.2.2. User login

The Food Delivery Application shall provide a secure login facility for registered customers.

The system shall:

- Verify the customer's email address and password against the Customer Database.
- Allow access only when the entered credentials are valid.
- Display an appropriate error message when invalid credentials are entered.
- Redirect the customer to the Home Screen after successful login.

3.2.3. Browse restaurants

- The system shall allow customers to browse available restaurants.
- The system shall display the restaurant name, cuisine type, rating, location, and availability.
- The system shall allow customers to search for restaurants by name or cuisine.

- The system shall allow customers to filter restaurants based on rating, cuisine, price range, and delivery time.
- The system shall display the menu and food items offered by the selected restaurant.
- The system shall display the price and availability of each food item.
- The system shall allow customers to select food items and add them to the cart.

3.2.4. Search food

- The system shall allow customers to search for food items by entering the food name or keyword.
- The system shall display relevant food items matching the customer's search.
- The system shall display the food name, description, price, restaurant, and availability.
- The system shall allow customers to filter search results by category, price range, rating, and availability.
- The system shall allow customers to select a food item and view its details.
- The system shall allow customers to add the selected food item to the cart.

3.2.5. Cart management

- The system shall allow customers to add food items to the cart.
- The system shall display the selected food items, quantity, price, and total amount.
- The system shall allow customers to increase or decrease the quantity of food items.
- The system shall allow customers to remove food items from the cart.
- The system shall automatically calculate the total order amount based on the selected items and quantities.
- The system shall allow customers to review their cart before placing an order.

- The system shall allow customers to proceed to **checkout and payment** from the cart.

3.2.6. Offer management

- The system shall allow administrators to create, update, and remove offers.
- The system shall allow administrators to set discount percentages or fixed discount amounts.
- The system shall allow administrators to define the validity period of each offer.
- The system shall display available offers to customers.
- The system shall allow customers to apply valid offers or coupon codes to their orders.
- The system shall automatically calculate and apply the discount to the order total.
- The system shall prevent the use of expired or invalid offers.

3.2.7. Place order

- The system shall allow customers to place an order for the selected food items.
- The system shall display the order summary, item quantities, prices, applicable discounts, delivery charges, and total amount before confirmation.
- The system shall allow customers to select or enter a delivery address.
- The system shall generate a unique order number for each confirmed order.
- The system shall record the order details in the Order Database.
- The system shall provide an order confirmation after successful placement.
- The system shall update the order status to “Order Placed” and notify the customer.
- The system shall allow customers to track the order status after placing the order.

3.2.8. Payment

- The system shall allow customers to select a preferred payment method.
- The system shall support payment methods such as UPI, debit/credit cards, net banking, and cash on delivery, where applicable.

- The system shall display the total payable amount before payment confirmation.
- The system shall securely process and verify the payment transaction.
- The system shall record payment details and transaction status in the Payment Database.
- The system shall provide a payment confirmation or failure message to the customer.
- The system shall generate or provide a digital receipt for successful payments.
- The system shall update the order status after successful payment.

3.2.9. Order cancellation

- The system shall allow customers to cancel an order within 2 minutes of placing it.
- The system shall not allow cancellation after the 2-minute cancellation period has expired.
- The system shall update the order status to “Cancelled” immediately after successful cancellation.
- The system shall notify the restaurant and customer when an order is cancelled.
- If payment has already been completed, the system shall initiate a refund according to the applicable refund policy.
- The system shall maintain a record of the cancellation in the Order Database.

3.2.10. order tracking

- The system shall allow customers to track the status of their orders in real time.
- The system shall display the current order status, such as Order Placed, Confirmed, Preparing, Out for Delivery, and Delivered.
- The system shall provide the estimated delivery time to the customer.
- The system shall update the order status whenever there is a change in the delivery process.

- The system shall notify customers about important order and delivery status updates.
- The system shall allow customers to view their order details and delivery information.

3.2.11. Ratings and Reviews

- The system shall allow customers to rate restaurants and food items after completing an order.
- The system shall allow customers to provide a written review along with their rating.
- The system shall allow customers to give a rating on a 1-to-5 star scale.
- The system shall display ratings and reviews for restaurants and food items.
- The system shall allow administrators to monitor and manage inappropriate reviews.
- The system shall ensure that only customers who have completed an order can submit a rating or review.

3.2.12. Notifications

- The system shall send notifications to customers regarding their orders.
- The system shall notify customers when an order is placed, confirmed, prepared, dispatched, and delivered.
- The system shall send a notification when an order is cancelled or delayed.
- The system shall notify customers about successful or failed payments.
- The system shall notify customers about new offers, discounts, and promotional activities.
- The system shall allow customers to enable or disable promotional notifications.
- The system shall display notifications within the application and, where applicable, through email or push notifications.

3.3. Non-functional requirements

Non-functional requirements describe how the system should perform, rather than what functions it should provide. They define the system's quality, performance, security, reliability, usability, and scalability.

3.3.1. Performance

- The system should respond to user requests within 2–3 seconds under normal conditions.
- The system should support multiple users simultaneously without significant performance degradation.
- Food search and menu loading should be fast and responsive.
- Order placement and payment processing should be completed without unnecessary delays.
- Order status should be updated quickly and accurately.
- The system should efficiently handle large amounts of customer, order, and payment data.
- The application should maintain acceptable performance during peak ordering hours.

3.3.2. Security

- The system shall protect customer personal and payment information from unauthorized access.
- User passwords shall be stored securely and not in plain text.
- The system shall provide secure login and authentication.
- Only authorized users shall be allowed to access admin and management functions.
- Payment transactions shall be processed through secure and trusted payment gateways.

- The system shall use HTTPS encryption for communication between users and the server.
- The system shall protect against unauthorized modification or deletion of customer, order, and payment data.
- The system shall maintain regular data backups to prevent data loss.

3.3.3. Availability

- The system should be available 24/7, except during scheduled maintenance.
- The application should remain accessible during peak ordering hours.
- Planned maintenance should be performed with minimum service interruption.
- The system should recover quickly from unexpected failures.

3.3.4. Reliability

- The system should operate consistently without frequent failures.
- Customer, order, and payment data should be stored accurately.
- The system should recover quickly from system failures or errors.
- Regular data backups should be maintained to prevent data loss.

3.3.5. Usability

- The system should have a simple and user-friendly interface.
- Users should be able to easily navigate through the application.
- Food search, ordering, and payment processes should be easy to understand.
- The system should provide clear messages and instructions to users.

3.3.6. Compatibility

- The system should support Windows, macOS, Android, and iOS.

- The web application should work with modern browsers such as Chrome and Firefox.
- The system should be compatible with desktop, tablet, and smartphone devices.
- The application should provide a consistent experience across supported platforms.

3.3.7. Maintainability

- The system should have a modular and well-structured design.
- The code should be easy to understand, modify, and update.
- New features should be added with minimal changes to existing components.
- The system should be easy to diagnose and fix when errors occur.

3.4. Logical Database Requirements

The Food Delivery Application shall maintain a structured database to store and manage all important system information. The database should ensure data accuracy, consistency, security, and easy retrieval.

- The system shall maintain databases for customers, restaurants, food items, orders, payments, offers, and reviews.
- Each customer, restaurant, food item, and order shall have a unique identifier.
- The database shall store customer details such as name, email, password, phone number, and delivery address.
- The Order Database shall store order ID, customer details, food items, quantity, price, order status, and delivery information.
- The Payment Database shall store payment ID, order ID, payment method, amount, date, and transaction status.
- The system shall maintain relationships between customers, orders, restaurants, food items, and payments.
- The database shall prevent duplicate and inconsistent data and maintain data integrity.
- Appropriate access controls shall be applied to prevent unauthorized modification or deletion of data.

4. Business rules

- Customers must be registered and logged in to place an order.
- Customers can cancel an order only within 2 minutes of placing it.
- An order can be placed only when the selected food items are available.
- Payment must be completed through a valid payment method before the order is confirmed, except for Cash on Delivery.
- Only authorized admins or restaurant staff can add, update, or remove food items and offers.
- Customers can submit ratings and reviews only for completed orders.
- Applicable offers and discounts can be used only within their validity period.
- Restaurants receive orders only during operating hours.
- Delivery partners are assigned based on nearest location.
- Refund follows the cancellation policy.
- Rating can only be submitted after successful delivery.

5. Use cases

Use cases describe the interactions between users and the Food Delivery Application to achieve specific goals. They provide a clear view of how different users interact with the system and how the system responds to their actions.

The main actors of the system are Customer, Admin, and Restaurant Staff. The use cases cover activities such as registration, login, browsing restaurants, ordering food, payment, order tracking, and management of the application.

5.1. Register account and login

Actor: Customer

Purpose: To allow customers to create an account and securely access the Food Delivery Application.

Precondition: Customer must have a valid email address and the application must be available.

Main Flow:

1. Customer selects Register and enters name, email, password, and address.
2. System validates the entered information and creates the customer account.
3. System sends a verification email to the registered email address.
4. Customer enters the registered email and password to log in.
5. System verifies the credentials and grants access.
6. Customer is redirected to the Home Screen after successful login. c

Alternative Flow: If the details or login credentials are invalid, the system displays an appropriate error message.

Postcondition: The customer is successfully registered and can securely access the application.

5.2. User places an order

Actor: Customer

Purpose: To allow the customer to select food items and place an order.

Precondition: Customer must be logged in and the selected food items must be available.

Main Flow:

1. Customer browses or searches for food items.
2. Customer selects food items and adds them to the cart.
3. Customer reviews the cart and confirms the order details.
4. Customer selects the delivery address and payment method.
5. System calculates the total amount and processes the payment.
6. System generates a unique Order ID and confirms the order.
7. System notifies the customer and restaurant about the new order.

Alternative Flow: If an item is unavailable or payment fails, the system displays an appropriate message and the order is not confirmed.

Postcondition: The order is successfully placed and its status is set to “Order Placed.”

5.3. Restaurants accept order

Actor: Restaurant Staff

Purpose: To allow the restaurant to review and accept a customer's order.

Precondition: A customer has successfully placed an order.

Main Flow:

1. Restaurant receives a notification of the new order.
2. Staff views the order details and checks food availability.

3. Staff accepts the order.

राष्ट्रीय इलेक्ट्रॉनिकी एवं सूचना प्रौद्योगिकी संस्थान
National Institute of Electronics & Information Technology
(DEEMED TO BE UNIVERSITY - Under Distinct Category)

4. System updates the order status to “Accepted”.

5. Customer is notified that the restaurant has accepted the order.

Alternative Flow: If the restaurant cannot fulfil the order, it may reject it and the system notifies the customer.

Postcondition: The accepted order is sent for food preparation.

5.4. Delivery partner delivers order

Actor: Delivery Partner

Purpose: To deliver the customer's order to the specified delivery address.

Precondition: The restaurant has prepared and dispatched the order.

Main Flow:

1. Delivery partner receives the delivery request and order details.
2. Delivery partner picks up the order from the restaurant.
3. System updates the status to “Out for Delivery.”
4. Delivery partner delivers the order to the customer.
5. System updates the status to “Delivered.”
6. Customer receives a delivery confirmation notification.

Alternative Flow: If delivery cannot be completed, the delivery partner updates the delivery status and the system notifies the customer.

Postcondition: The order is successfully delivered and marked as “Delivered.”

5.5. Customer rates and reviews order

Actor: Customer

Purpose: To allow the customer to provide feedback after receiving the order.

Precondition: The order must be successfully delivered.

Main Flow:

1. Customer opens the completed order.
2. Customer provides a rating and optional review.
3. System validates and saves the feedback.
4. System displays the submitted rating and review.

Postcondition: The customer's rating and review are stored successfully.

6. System design

This section presents the design of the Food Delivery Application through visual representations of its main user interfaces. The included interface designs show how users will interact with the system and access its major features. These designs provide a clear visual understanding of the application's layout, navigation, and functionality.

6.1. Register and Login interface

6.2. User interface

6.3. Categories & food detail

6.4. Cart and order confirmation

6.5. Order delivered and rating

7. Diagrams

This section presents various diagrams that provide a visual representation of the Food Delivery Application. These diagrams help to understand the system structure, user interactions, data flow, and relationships between different components of the application.

7.1. UML class diagram

7.2. Use case diagram

7.3. Data flow diagram

8. Acceptance criteria

The Food Delivery Application will be considered successfully completed when it satisfies the functional and non-functional requirements specified in this SRS document. The following criteria will be used to verify that the system is ready for deployment and use.

- The system shall allow customers to register, verify their account, and securely log in using valid credentials.
- Customers shall be able to browse restaurants, search for food, view menus, and check food availability and prices.
- Customers shall be able to add, update, and remove food items from the cart and view the correct order total.
- Customers shall be able to place orders by providing a valid delivery address and selecting an available payment method.
- The system shall generate a unique order ID and store the order details correctly in the database.
- Restaurants shall be able to receive, accept, reject, and update the status of customer orders.
- Customers shall be able to cancel an order within 2 minutes of placing it, subject to the defined cancellation policy.
- The system shall process payments securely and display the correct payment status and transaction information.
- Delivery partners shall be able to receive delivery requests, update delivery status, and complete deliveries.
- Customers shall be able to track their orders and receive relevant status notifications.

- Customers shall be able to rate and review their experience after an order has been successfully delivered.
- Administrators shall be able to manage users, restaurants, food items, offers, orders, and other required system data.
- The system shall protect customer and payment information through appropriate authentication, authorization, and security mechanisms.
- The application shall provide acceptable performance, reliability, usability, and availability under normal and peak usage conditions.
- All major functions shall be tested successfully, and the system shall operate without critical errors or data loss.
- The final application shall be user-friendly, maintainable, scalable, and compatible with the platforms and browsers specified in this SRS.
- The system shall be considered ready for deployment only when the specified requirements are implemented, tested, and approved by the relevant stakeholders.

9. Validation questions

- Are all the requirements clear, complete, and unambiguous?
- Can each requirement be tested and verified?
- Does the system provide all the required functions for customers, restaurant staff, admins, and delivery partners?
- Are the requirements consistent with each other?
- Are security and customer data protection requirements clearly defined?
- Can the system handle the expected number of users and orders?
- Are the requirements for payment, order cancellation, and refunds clearly defined?
- Are the requirements for order tracking and delivery complete?
- Can the proposed system be developed within the specified time and budget constraints?
- Are the requirements flexible enough for future enhancements?

10. Conclusion

The Software Requirements Specification for the Food Delivery Application provides a clear and structured description of the system's requirements, functions, interfaces, and constraints. It defines how customers, restaurant staff, administrators, and delivery partners will interact with the application.

The SRS serves as a foundation for the design, development, testing, and deployment of the system. By following the requirements defined in this document, the Food Delivery Application can be developed as a reliable, secure, user-friendly, and scalable system that meets the needs of its users and supports efficient food ordering and delivery.
